Software Name	Password Manager		

1. Problem Statement

Computers and the Internet are being used extensively and the security of users' privacy has become a big issue. One of the oldest ways to provide security is using passwords. Choosing and storing passwords are hard tasks for the majority of the users and cause millions of breaches. Since the number of websites that we use every day is increasing, this causes most users to choose simple memorable passwords, store them improperly, or reuse them for many websites/applications that increase the risk of being cracked. The existing password managers are not reliable because there is always the risk of leaking our information to the developers of the software!

2. Functional Requirements

The password manager should have the following minimum features:

1. The application shall be multiuser.
2. The user shall log in/signup/reset the password when running the application.
3. The user's login password (aka master password) shall be reset by one security question that is set during signup.
4. The application shall store the username, password, website/application name, specified email, creation date, expiration date
5. The application shall generate a password based on the given criteria:
 - Minimum/maximum lengths of the generated password can be set to any non-zero positive integer

- The option of including special characters
(!"#\$%&'()*+,-./:;<=>?@[\\]^_`{|}~)
 - The option of including capital letters. In this case, the user needs to specify how many capital letters are required.
6. The passwords shall be encrypted before storing and decrypted before retrieving. For security purposes, the code of encryption/decryption will be provided by the client (the professor).
 7. The password shall be copied in the clipboard by a button.
 8. The application shall warn the user about the expired passwords right after successful login to the system.
 9. The user shall search based on the website/application name or username.
 10. The user shall modify the information of the application.
- When the user updates the duration of the password, the current expiration day will not change. New duration will apply for the next time when the user updates their old password.
